150mm radial bend
It is recommended that SHADES provide a template for all flush-mount curved tracks

All measurements supplied are in millimetres.
Information is general only, and not 'site-specific'.
Contact SHADES to arrange a site visit to discuss further.

Type: FM1

Example below of the preparation works required for an FM1 track installation.

- 90mm * 35mm timber has been installed with the underside of the timber, level with the top edge of the plaster, or the underside of the furring channels.
- The timber was pre-routed at a width of 22mm wide and 4mm deep, at a spacing of 60mm to the centre of the routed section from the back wall (NOTE - This 60mm to the centre needs to be from the back wall OR any point of obstruction. I.e. a window mullion)
- Once the ceiling is sheeted with the plaster, the 4mm routed section in combination with the 10mm plaster provides a 14mm depth.
- Ideally the plasterer will use a plaster tear-away strip on each plastered edge, leaving a clean-edged 22mm wide X 14mm deep opening.
- SHADES can then install the track, with a 2mm lip, and 1mm on each side for a clean caulked finished.

All measurements supplied are in millimetres.
Information is general only, and not 'site-specific'.
